VibeCoding with GitHub Copilot

Build more, type less.

Turn your ideas into working results while Copilot handles the busywork.

What you'll take away

- **What "VibeCoding" means** (in plain language)
- **How Agent Mode helps:** plans → acts → reports back
- **Everyday workflows** you can automate
- **A simple calculator demo**
- **Tips** to get great results without deep tech

What is VibeCoding?

VibeCoding is **creating software by describing outcomes**, not writing every line.
You **explain the goal**, Copilot **proposes a plan**, runs tools, and **brings back results** for you to approve or refine.

- Speak in tasks and examples, not syntax
- Review quickly, iterate fast
- Ship value with fewer handoffs

Why it matters (for everyone)

- **Speed:** from idea → prototype → iteration in hours
- **Access:** non-specialists can contribute meaningfully
- **Focus:** you spend time on decisions, not boilerplate
- **Quality:** quick feedback loops reduce rework

Meet your host

Agent Mode in one sentence

Agent Mode = your AI teammate that can **plan steps and take actions** (edit files, run commands, open issues, test code) while **keeping you in the loop** for approvals.

How it feels (no jargon)

1. **Say the goal**
   “Create a lightweight web tool that calculates costs and shares a link.”
2. **Copilot proposes a plan**
   Pages, buttons, quick tests, and a share action.
3. **You approve** parts of the plan.
4. **Copilot executes** and reports back results.
5. **You tweak the experience** (“Make it dark mode and add export to CSV.”)

Connecting Copilot to the world (simple view)

Think of **plugins** that let Copilot act:

- **Browser & testing** (e.g., run a quick test)
- **GitHub** (create issues, open PRs)
- **Docs & data** (read a sheet, summarise a PDF)
- **Local tasks** (edit files, run a script)

All **with your approval** and a clear activity log.

What can you automate this week?

- **Housekeeping:** organise a repo, add README, clean up TODOs
- **Quality sweep:** generate basic tests, run them, summarise failures
- **Documentation:** draft “getting started,” add screenshots, create a changelog
- **Backlog hygiene:** triage issues, label, create follow-ups
- **Demos:** spin up a simple calculator or form app and share a link

Demo: Let’s build a calculator together!

Goal: a playful calculator with a crisp UI and a shareable result.

1. **Ask Copilot:** “Create a simple calculator app with two inputs and a total button.”
2. **Approve the plan:** Copilot suggests the layout, files, and logic.
3. **Polish it:** “Add dark mode, make it mobile-friendly, and export results.”
4. **Test it:** “Add a quick test and show me the result.”
5. **Share:** Copilot packages the app and gives you a link or ZIP.

VibeCoding for business teams

- **Ops:** auto-generate runbooks from steps you already do
- **Sales/Success:** tailor a demo workspace and capture notes into CRM
- **HR/Comms:** draft FAQ pages from existing documents
- **Finance/PMO:** reconcile lists, flag anomalies, summarise trends

Guardrails that build trust

- **You approve actions**; nothing runs silently
- **Readable plans** before execution
- **Activity history** you can review
- **Scoped access** to only the tools you enable

Tips for great outcomes

- Start with a **clear, small goal**
- Ask for a **plan first**, then approve in chunks
- Provide **examples** of “good” vs “not good”
- Iterate: “**Tighter copy**, fewer clicks, add tooltip”
- Use **screenshots** and small files to guide changes

VibeCoding mindset (quick check)

If you had a talented new teammate, you would **break work into steps, give context, review, and coach**.
Treat Copilot the **same way**—and it shines.

Quick FAQ

Is this coding without coding?
Not exactly—**it's directing** the coding with faster feedback loops.

What if it makes a mistake?
That's expected—**review, nudge, and retry**. It's fast.

Where do I start?
Pick a **tiny workflow** you repeat weekly; automate that first.

Thank you!

Fair winds & happy coding!
